

Official Guide & Documentation

Company Profile Website Template With Custom CMS

1. Introduction

This documentation is prepared as a comprehensive guide to assist with installation, configuration, usage, content customization, and management of the Content Management System (CMS) for homepage promotional banners, articles, news, blogs, and promotional content. All discussions are presented systematically to be easily understood by both beginner users and developers. This template is developed using PHP 8.0.30, Tailwind CSS, and MySQL with PDO (PHP Data Objects) supported by prepared statements to provide higher security by preventing SQL injection attacks. The combination of these technologies produces a modern, responsive, secure, easily expandable website with optimal performance to meet company profile website requirements.

2. Server Specifications & Requirements

To ensure the website runs smoothly, securely, and without issues, make sure your hosting server meets the following minimum specifications:

Component	System Requirement	Description
PHP Version	PHP 8.0.30 (or 8.x compatible)	Mandatory to use PHP 8.0.30 according to template development standards.
Web Server	Apache / Nginx	Apache is highly recommended because it uses the <code>mod_rewrite</code> module for clean URLs.
Database	MySQL / MariaDB	Uses the PHP PDO extension for secure connections against SQL Injection.
PHP Extensions	PDO, OpenSSL, Mbstring, cURL, GD	Ensure these extensions are active in cPanel/Hosting <code>php.ini</code> .

3. Technology & Library Structure

This template is built using a combination of modern technologies and leading third-party libraries:

- **PHP (Backend & Routing):** Handles server logic, PDO database connections, clean URL routing, and modularization of header, navigation, footer files, and the WhatsApp widget.
- **Tailwind CSS (Styling):** A utility-first CSS framework for a modern, aesthetic, and fast responsive design.
- **FontAwesome (Iconography):** Used for visual support icons on buttons, navigation, and contact information.
- **Swiper.js (Slider):** A high-performance JavaScript plugin for partner logo carousels and interactive banners.
- **MySQL (PDO):** Database system with secure connections using prepared statements.
- **Quill (Rich Text Editor):** Used in the CMS for managing articles, news, blogs, and promotional content with heading, list, and link text formatting.
- **PHPMailer (Email Handler):** A reliable PHP library for sending system emails securely using the SMTP protocol.

4. Project File & Folder Structure

Below is the latest directory structure of the website template:

```
/ (Website Root Directory)
├── index.php                # Homepage.
├── about.php               # About Us Page.
├── products.php           # Our Products Page.
├── blog.php               # Blog Page.
├── blog-filter.php        # Blog Page Handler.
├── blog-detail.php        # Blog Detail Page Handler.
├── career.php             # Career Page (Send email message).
├── .htaccess              # URL Rewriting & Clean URL Configuration (Slug).
├── robots.txt            # Crawling Configuration (Search Engine).
├── sitemap.php            # Dynamic Sitemap Generator.
├──
├── includes/              # Website Component Folder.
│   ├── .htaccess         # Access Security Configuration (Includes Folder).
│   ├── header.php        # HTML Head, Meta Tags, SEO Section.
│   ├── navigation.php    # Website Navigation Section.
│   ├── whatsapp.php      # WhatsApp Button Section.
│   └── footer.php        # Website Footer Section.
├──
├── config/               # System Configuration Folder.
│   ├── .htaccess         # Access Security Configuration (Config Folder).
│   ├── config.php        # Database Connection Configuration.
│   └── career-config.php  # Email Connection Configuration.
├──
├── admin/                # Admin CMS Panel Folder.
│   └── index.php          # CMS Login and Dashboard Page.
```

└─ banners.php	# Hero Banner Management CMS Page.

└─ posts/	# Blog Page Post Image Uploads.
└─ libraries/	# External Library Folder.
└─ .htaccess	# Access Security Configuration (Libraries Folder).
└─ PHPMailer/	# External Email Sending Library Folder.

5. Hosting & Domain Installation Guide

Follow the steps below to upload and configure the template on a hosting server:

1. **Domain & Hosting Preparation:** Ensure the domain has been pointed to the hosting nameservers and your cPanel/DirectAdmin account is active.
2. **Upload Files:** Go to **cPanel > File Manager** or use an FTP client (FileZilla). Upload all project files to the `public_html/` directory (or a subfolder if testing in a subdirectory).
3. **Create a MySQL Database:** The database is used by the website to store all application data.

```
1. Log in to cPanel, then open the MySQL Database Wizard menu.
2. Create a database name as needed (free choice, example: website_database or company_db ).
3. Create a database user account along with its password.
   Example:
   Username : company_user
   Password : *****
4. Click Create User to save the database account.
5. Grant full privileges (All Privileges) to the database user.
6. Click Make Changes to save settings.
7. Note down the credential information as it will be used in the config/config.php file.
```

4. **Import Database File (.sql):** All table structures and initial data (including the `users` table for admin, posts, and banners) are combined into a single file inside the project's `database/` folder. This file name is flexible and can be freely changed (example: `website_database.sql` or `company_db.sql`).

```
1. Open the phpMyAdmin service via your cPanel panel.
2. In the left navigation panel, click the database you just created.
3. Click the Import tab on the top navigation menu of phpMyAdmin.
4. Under File to import, click the Choose File / Browse button, then find and select the database file in .sql format located inside the project's database/ folder.
5. Leave other configuration options at their default values, such as the SQL format and utf8mb4 character set.
6. Scroll down to the bottom, then click the Go / Kirim button to start the import process.
7. Wait until a green success notification appears stating that the import process was successful. All tables and admin data will be automatically fully populated.
```

Default Administrator Account Information:

After a successful import, you can immediately log into the CMS (Admin) page using the following default credentials:

- **Username:** `admin`
- **Password:** `@Admin123`

5. **Database Connection Configuration:** Open the `config/config.php` file and adjust the database name, username, and password to match what you created in cPanel:

```
$host = 'localhost';
$dbname = 'your_database_name'; // Match with your cPanel database name (e.g., 'website_database' or 'company_db')
```

```
$username = 'your_db_username';
$password = 'your_db_password';
```

6. **.htaccess** File Settings (URL Rewriting):

Make sure the `mod_rewrite` module is enabled on the Apache server. Since the website is installed directly at the root domain (`https://yourdomain.com/`), adjust the contents of the root `.htaccess` file as follows:

```
RewriteEngine On
RewriteBase /

# Sitemap rule
RewriteRule ^sitemap\.xml$ sitemap.php [L]

# Fix blog slash
RewriteRule ^blog/$ /blog [R=301,L]

# Blog list page
RewriteRule ^blog$ blog.php [L,QSA]

# Blog detail page
RewriteRule ^blog/([a-zA-Z0-9-]+)$ blog-detail.php?slug=$1 [L,QSA]

# Hide php extension
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond %{REQUEST_FILENAME}\.php -f
RewriteRule ^([^\.]*)$ $1.php [NC,L]

# Clean URL redirect
RewriteCond %{THE_REQUEST} ^[A-Z]{3,}\s([^.]+)\.php [NC]
RewriteCond %{REQUEST_URI} !blog-filter\.php$
RewriteCond %{REQUEST_URI} !^/admin/
RewriteRule ^ %1 [R=301,L]
```

7. File & Folder Permissions Settings:

Ensure file and folder permissions on your server are properly configured so the website runs normally without issues:

- **For Directories:** Set permissions to **755** (applies to all major folders such as `public_html/` , `config/` , `database/` , etc.).
- **For Files:** Set permissions to **644** (applies to PHP script files and the `.htaccess` file).

How to set in cPanel File Manager: Right-click the folder or file you want to modify, select **Change Permissions**, enter the appropriate value (`755` for folders or `644` for files), then click the **Change Permissions** button.

Note: If you encounter issues like a *500 Internal Server Error* or *403 Forbidden*, double-check that folder permissions are not set to *777* (as it is overly loose and dangerous for server security).

6. Email & Job Application System (Career) Configuration Guide

The job application submission module on the `career.php` page and the processing script `config/career-config.php` use the **PHPMailer** library to securely send applicant data along with document attachments to the company's email server. Below are the configuration details and mechanisms:

A. Attachment Storage Directory Settings

The system automatically handles CV and Portfolio file uploads with the following technical provisions:

- **Target Directory:** Applicant files are temporarily stored in the `public/uploads/career/` folder before being sent via email, and then automatically cleaned up after the sending process is complete.
- **File Size Validation:**
 - **CV / Resume** attachments are limited to a maximum of **2 MB**.
 - **Portfolio** attachments are limited to a maximum of **10 MB** (optional).
- **File Format Validation (MIME Type):** The system verifies file types using the `finfo` function to ensure only valid document formats can be uploaded:
 - `application/pdf` (PDF)
 - `application/msword` (DOC)
 - `application/vnd.openxmlformats-officedocument.wordprocessingml.document` (DOCX)

B. SMTP Credential Configuration in `config/career-config.php`

Open the `config/career-config.php` file, then adjust the SMTP mail server connection parameters using the company domain email account:

```
$mail->isSMTP();
$mail->Host      = 'mail.yourdomain.com';           // Match with your email server SMTP
host
$mail->SMTPAuth  = true;
$mail->Username  = 'hrd@yourdomain.com';           // Sender email address / SMTP
username
$mail->Password  = 'your_email_password';          // Company email account password
$mail->SMTPSecure = PHPMailer::ENCRYPTION_SMTPS;
$mail->Port      = 465;                             // SMTP port (usually 465 for SMTPS)
```

C. Destination Email Routing Configuration Based on Job Position

The system supports automatic routing of job applications to the relevant department's email address based on the job position selected in the form. This condition can be customized in the `config/career-config.php` file:

- Positions such as **Graphic Design** or **Sales Marketing** on this website serve only as implementation examples for sorting email destination addresses based on the submitted position value.

- Each job position can be mapped to a specific desired email address (e.g., `graphic@yourdomain.com` or `sales@yourdomain.com`).
- If the applied position does not match any specific condition defined, the system will automatically route the email to the main default email address (e.g., `hrd@yourdomain.com`).
- The system sender address is set using `no-reply@yourdomain.com` .
- The conditional logic for positions and the addition of target email addresses can be modified, added, or reduced at any time according to the active job vacancies list.

7. Detailed Website Content & Configuration Modification Guide

Managing and customizing website content (ranging from global framework components to main pages) can be done by editing the following structured PHP files:

A. Global Configuration: Header, Navigation, WhatsApp, and Footer

The website's global framework and components are managed via the `includes/` directory and main configuration files:

- **Header (`includes/header.php`):**
 - Change the `$site_name` variable value from the default `"Company"` to your actual brand name or corporate entity.
 - Adjust the `$default_desc` variable with the main company description for Search Engine Optimization (SEO) and Open Graph tags.
 - The structured data schema (JSON-LD Organization) at the bottom of this file will automatically adjust to the entity name and main server domain.
- **Navigation (`includes/navigation.php`):**
 - Main navigation menu settings (such as *About Us*, *Our Products*, *Blog*, and *Career*) are defined inside the `$menu` array. Menu links or labels can be added, reduced, or modified through this array.
 - Adjust the logo text or image on the main link elements referring to the logo assets folder if needed.
- **Floating WhatsApp Button (`includes/whatsapp.php`):**
 - Replace the phone number in the link attribute `https://wa.me/6287654321111` with your active official WhatsApp number using the international format (without plus (+) or dash (-), example: `6281234567890`).
- **Footer (`includes/footer.php`):**
 - **Social Media:** Update the URL list in the `$socials` array to link Facebook, Instagram, TikTok, LinkedIn, and YouTube icons to the company's official accounts.
 - **Contacts:** Adjust the `$contacts` array to change the email address (e.g., from `email@company.com`), phone number, and company WhatsApp number link.

- **Head Office:** Modify the coordinate or location parameters on the Google Maps `<iframe>` tag as well as the physical address text to match actual operational points.
- **Copyright:** Replace the brand name text on the copyright line at the bottom of the file to match your corporate identity.

B. Content Customization (Home, About Us, Our Products, Blog, and Career)

Each main page has its own internal data variable structure that can be modified directly in their respective PHP files:

- **Homepage / Home (`index.php`):**
 - Change the `$page_title` and `$page_description` variables from default values to match the **Homepage** content.
 - **Hero Banner:** Modify data in the `$default_slides` array to change background images (desktop and mobile), headlines, descriptions, and Call to Action (CTA) button links. This serves as default data if no records exist in the database.
 - **Partners:** Replace partner logo image files inside the `public/assets/partners/` folder and adjust the filename list in the `$partners` array.
 - **User Reviews:** Modify data in the `$reviews` array to update names, testimonial text, and reviewer profile photos (stored in the `public/assets/user/` directory).
 - **E-Commerce Stores:** Adjust e-commerce store data to change the company's official marketplace platform links (such as Shopee, Tokopedia, TikTok Shop, or Blibli) and update the filename list in the `$stores` array.
 - **Retail Network:** Replace logo files in the `public/assets/offline-store/` directory or adjust the filename list in the `$retail` array.
 - **Location Map:** It is strongly recommended to visually adjust the company's operational territory by replacing the regional map image in the `public/assets/place/` folder.
- **About Us Page (`about.php`):**
 - Change the `$page_title` and `$page_description` variables from default values to match the **About Us** content.
 - **Company Tagline:** Modify the headline text in the middle of the page representing the company's motto or slogan.
 - **Milestones / Company History:** Adjust the `$timeline_data` array to change year ranges and descriptions of historical corporate achievements over time.
 - **Executive Team:** Edit leadership data to change names, titles, quotes, descriptions in the `$executives` array, and replace executive photo files in the `public/assets/profile/` directory.
 - **Vision and Mission:** Modify paragraph text in the Vision and Mission containers to reflect the strategic direction of the company.
 - **Company Values:** Adjust FontAwesome icon class elements and description text for core company values in the `$values` section.

- Change product hero banner images in the `public/assets/banners/` (`banner-about.webp` and `banner-about-mobile.webp`) folder if necessary.
- **Products Page (`products.php`):**
 - Change the `$page_title` and `$page_description` variables from default values to match the **Products** content.
 - Edit the product array to change the list of products, names, subtitles, prices, images, and detailed product descriptions in the `$products` array.
 - Replace promotional video titles and descriptions in GIF format within the `public/assets/product/` folder and match the path name to the file name.
 - Change product hero banner images in the `public/assets/banners/` (`banner-products.webp` and `banner-products-mobile.webp`) folder if necessary.
- **Blog Page (`blog.php`):**
 - Change the `$page_title` and `$page_description` variables from default values to match the **Blog** content.
 - Article categories are retrieved dynamically straight from the `posts` database table based on the `type` column, allowing category management through post data management inside the CMS.
 - If updating title names in content, slug or URL link parts will automatically update.
 - Change product hero banner images in the `public/assets/banners/` (`banner-blog.webp`) folder if necessary.
- **Career Page (`career.php`):**
 - Edit job vacancy data to add, remove, or update available job positions (including categories, position titles, descriptions, requirements lists in HTML tag format, and responsibility details).
 - If you want to hide a specific job vacancy without permanently deleting it from the source code, data can be disabled using PHP comments (`//hidden`) or by adding conditional logic.
 - Ensure that email transmission configuration parameters in the connected script directory are adjusted so application submission forms function optimally.
 - Change product hero banner images in the `public/assets/banners/` (`banner-career.webp`) folder if necessary.

C. SEO Settings, Google Search Console Registration, and Supporting Files

To ensure the website is recognized, indexed, and optimally registered on search engines like Google, several supporting file configurations and domain ownership verifications must be performed:

- **Main Domain Customization:** Replace all placeholder addresses with actual active domain names inside the `robots.txt` and `sitemap.php` files.
- **`robots.txt` File:**
 - This file provides instructions to search engine crawlers regarding pages allowed for access.

- Ensure the sitemap pointer line points precisely to the main domain (e.g., `Sitemap: https://maindomain.com/sitemap.xml`).
- **Dynamic Sitemap File (`sitemap.php` & `.htaccess`):**
 - This site map is generated dynamically using `sitemap.php` which automatically combines static pages and recent posts/articles from the MySQL database.
 - Ensure the domain in the static page array inside the `sitemap.php` file matches the website's actual domain.
 - Even though the file format is `sitemap.php` , search engines access it via the standard URL `sitemap.xml` thanks to the rewrite rule in the `.htaccess` file (`RewriteRule ^sitemap\.xml$ sitemap.php [L]`), meaning new articles automatically enter the sitemap without manually editing an XML file.
- **Google Search Console Verification (Code Injection):**
 - To register and verify site ownership on Google Search Console, copy the verification code provided by Google (usually an HTML meta tag like `<meta name="google-site-verification" content="unique_code" />`).
 - Paste the code inside the `<head>` tag section. The most appropriate placement is inside the `includes/header.php` file so the verification tag is automatically active and read across all website pages globally.

8. CMS Usage Guide (Promo E-Banners & Blog Content)

This template is equipped with a MySQL database-based CMS system to simplify dynamic content management without altering programming code:

A. Promo E-Banner Management (Homepage)

Promotional banners on the homepage (Hero Section) are managed through the admin panel:

- Administrators can access the admin panel by logging in through the login page on the main domain via the `/admin` link path).
- Banner data management connects directly to the `banners` database table containing columns: `image_desktop` , `image_mobile` , `headline` , `bodytext` , and `link` (CTA URL).
- If the database table is empty, the system automatically displays default banners (fallback slides) prepared in `index.php` .
- Promo banner management is handled through the CMS BANNER page: Banner Promotion. To create a new banner, select the Create menu. Created banners will appear in the History menu, where you can modify them by clicking Edit or remove them via the Delete button.

B. Blog & Article Content Management

The blog module integrates with the admin panel and a rich text editor (Quill) to simplify article management:

- Article management access is done by logging into the admin panel at `company.com/admin` linked to the `posts` database table.
- Main article attributes include: `id` , `title` , `slug` (for SEO-friendly URLs like `yourdomain.com/blog/article-name`), `type` (category), `description` (summary), `content` (full article text from Quill), `image` (featured image), and `date` .
- **Live Search & Categories:** The `blog.php` page features instant search (debounce search) and AJAX-based category filters (`blog-filter.php`) alongside sessionStorage support for optimal performance.
- **Blog Content Management:** The process of creating, editing, and publishing articles is handled directly through the admin panel using a rich text editor (Quill), which is then displayed dynamically and neatly on the `blog-detail.php` page.

Important Developer Note: Ensure all file permissions on the server are configured consistently across the entire project directory structure: `755` for all folders/directories and `644` for all files (including `.htaccess` files, PHP scripts, assets, and images). This standardized uniformity ensures that all security systems, script processing, and uploaded file storage directories function optimally and securely.
